

Fork Positioner for Forklift

Forklift Fork Positioners - The fork positioner is a hydraulic device that allows the driver to control the forklift without leaving the seat. They are made out of top quality materials and are meant to be able to endure the most difficult procedures and work surroundings. Side shifting units have the added ability to laterally position the entire load or the arms so as to facilitate more accurate carrying and placement in a faster and much more efficient way.

The only one of its kind blade pocket design enables the person operating it to be able to safely sway the unit's blades without any fear of damaging the positioning cylinders. This could allow the operator the choice to either perform independent or simultaneous fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages could be converted into blade positioners on existing units.
